I. GHP & HELD

Combining eq. 123, eq. 124 and eq. J.1a of [1] gives

$$\zeta = -\Psi_2^{-1/6}\bar{\Psi}_2^{-1/6}\rho^{-1/2}\bar{\rho}^{1/2} \quad (1)$$

$$\begin{aligned} B_a &= -\rho n_a + \tau \bar{m}_a, \\ B'_a &= -\rho' l_a + \tau' m_a. \end{aligned} \quad (2)$$

$$t_a = \zeta(B_a - B'_a) \quad (3)$$

$$\mathbb{L}_t \eta = t^a \Theta_a \eta - \frac{p}{2} \zeta \Psi_2 \eta - \frac{q}{2} \bar{\zeta} \bar{\Psi}_2 \eta = \zeta \rho' \mathbb{P} \eta - \zeta \rho \mathbb{P}' \eta - \zeta \tau' \bar{\partial} \eta + \zeta \tau \bar{\partial}'' \eta - \frac{p}{2} \zeta \Psi_2 \eta - \frac{q}{2} \bar{\zeta} \bar{\Psi}_2 \eta \quad (4)$$

$$\begin{aligned} \mathbb{P} \mathbb{P} \mathbb{P} \mathbb{P} (\zeta^4 \psi_4) &= \bar{\partial}' \bar{\partial}' \bar{\partial}' \bar{\partial}' (\zeta^4 \psi_0) - 3 \mathbb{L}_t \bar{\psi}_0, \\ \mathbb{P}' \mathbb{P}' \mathbb{P}' \mathbb{P}' (\zeta^4 \psi_0) &= \bar{\partial} \bar{\partial} \bar{\partial} \bar{\partial} (\zeta^4 \psi_4) + 3 \mathbb{L}_t \bar{\psi}_4. \end{aligned} \quad (5)$$

II. COMPONENTS OF HOMOGENOUS Φ

In this section, I express how one achieves a metric perturbation that falls fast enough at $\mathcal{I}^+$. To achieve this end I used the procedure demonstrated in details by Hollands et. al. in [1]. This method is based on the GHZ reconstruction [2] combined with the puncture scheme [3]. The puncture scheme implemented in [3] breaks the retarded solution h_{ab}^{ret} into two parts of punctured field h_{ab}^{P} which contains the singular field and the residual part h_{ab}^{Res} . The residual field satisfy a homogeneous linearized Einstein equation sourced by $\mathcal{E}h_{ab}^{\text{P}}$ away from the singular source, i.e.,

$$\mathcal{E}h_{ab}^{\text{Res}} = -\mathcal{E}h_{ab}^{\text{P}}. \quad (6)$$

The puncture field is an estimate for the singular field in a neighborhood of the orbiting compact object. This estimate is given by the product of the singular field and a $W(r, \theta, \phi)$ with the following properties:

1. W is compactly supported (usually $W = 0$ for $r < r_{\min}$ and $r > r_{\max}$, the support of W is called puncture region;
2. $W = 1$ on the location of the compact object.

One obvious choice would be $W(r) = \Theta(r - r_{\min}) - \Theta(r_{\max} - r)$ but one might choose a smooth one too. Consequently, residual field h_{ab}^{Res} is only sourced in the puncture region.

Applying $\mathcal{S}$ on both sides of (6) and using the Wald identity [?],

$$\mathcal{O}\psi_0^{\text{Res}} = -\mathcal{S}^{ab}T_{ab}^{\text{P}} = -T_0^{\text{P}}. \quad (7)$$

Using the Wald identity [?], we have

Combining eq. 123, eq. 124 and eq. J.1a of [1] gives

$$2\tilde{\mathbf{P}}'\tilde{\mathbf{P}}'\tilde{\mathbf{P}}'\bar{\psi}_0^{5\circ} = \tilde{\delta}'\tilde{\delta}'\tilde{\delta}'\tilde{\delta}'\tilde{\delta}\tilde{\delta}\tilde{\delta}\tilde{\delta}\bar{f}^\circ - 9\Psi^\circ\bar{\Psi}^\circ\tilde{\mathbf{P}}'\tilde{\mathbf{P}}'\bar{f}^\circ. \quad (8)$$

By expanding $\bar{f}^\circ$ and $\bar{\psi}_0^{5\circ}$ in spheroidal (spin-weighted harmonics in Schwarzschild) harmonics, one can reverse this equation and obtain $\bar{f}^\circ$. Next, we obtain following Held-like scalars $\Phi^{i\circ}$ from $\bar{f}^\circ$ (and potentially ODEs in terms of $\frac{\partial}{\partial u}$).

$$\tilde{\mathbf{P}}'\tilde{\mathbf{P}}'\Phi^{0\circ} = -\frac{1}{3}\tilde{\delta}'\tilde{\delta}'\tilde{\delta}'\tilde{\delta}\tilde{\delta}\tilde{\delta}\bar{f}^\circ - \left[2\bar{\tau}^\circ\tilde{\delta}'\tilde{\delta}\tilde{\delta} + \Psi^\circ\tilde{\delta}'\tilde{\delta} + 2\Psi^\circ\rho'^\circ\right]\tilde{\mathbf{P}}'\bar{f}^\circ \quad (9)$$

$$\tilde{\mathbf{P}}'\Phi^{1\circ} = -\tilde{\delta}'\tilde{\delta}'\tilde{\delta}\tilde{\delta}\bar{f}^\circ - \left[4\bar{\tau}^\circ\tilde{\delta} + 3\Psi^\circ\right]\tilde{\mathbf{P}}'\bar{f}^\circ \quad (10)$$

$$\Phi^{2\circ} = -2\tilde{\delta}'\tilde{\delta}\bar{f}^\circ, \quad (11)$$

$$\Phi^{3\circ} = -2\tilde{\mathbf{P}}'\bar{f}^\circ, \quad (12)$$

$$\bar{\zeta}_m^\circ = \tilde{\delta}\bar{f}^\circ, \quad (13)$$

$$\tilde{\mathbf{P}}'\zeta_l^\circ = -\text{Re}\left\{\tilde{\delta}\tilde{\delta}\bar{f}^\circ\right\}, \quad (14)$$

$$\tilde{\mathbf{P}}'\zeta_n^\circ = -\text{Re}\left\{\tilde{\delta}'\tilde{\delta}\tilde{\delta}\bar{f}^\circ - \rho'^\circ\tilde{\delta}\tilde{\delta}\bar{f}^\circ - 2\tau^\circ\tilde{\delta}\tilde{\mathbf{P}}'\bar{f}^\circ - \frac{1}{2}\Omega^\circ\tilde{\delta}\tilde{\delta}\tilde{\mathbf{P}}'\bar{f}^\circ\right\}, \quad (15)$$
